# Agenda

- Why use Vagrant?
- What is Vagrant?
- DevOps with Vagrant in mind

Operating System

- No Isolation.
- No Repeatability.
- No Verification.

Virtualized OS

Web  
Server

DB Server

App  
Server

Operating System

- Isolation
- Mirror Production
- Test Ops scripts with a free server
- Faster onboarding
- Designers/Managers can do it, too!

Dev and Ops

Not (Dev or Ops)

# #1 Dev Excuse

# Been there...

- Quick fix lost on a reboot!
- I thought that service never went down...
- Why did the database go down? My code doesn't do that.
- I thought this compiled code would run everywhere...

# Tao of Vagrant

- Developers can check out any code repository and **vagrant up**.
- Systems Ops engineers can **vagrant up** and have a complete sandbox matching production.
- With **vagrant up**, Automation engineers can work and use the same setup scripts in both dev and prod
- All this knowledge transfers to every project.

# Quick Demo

- Create and teardown virtual machines.
- Use automation to provision and configure.
- Network multiple machines.

# Alternatives

- Plain Desktop Virtualization
- Containers
- Cloud

# Demo

- Multi-Machine deployments.
- Package and distribute VM images.
- Plug-ins.
